## THROMBOCYTOPENIA IN A YOUNG DOG

Harold Tvedten
Clinical Chemistry Laboratory
University Animal Hospital (UDS)
Swedish University of the Agricultural Sciences (SLU)
Specimen: History, laboratory data and photomicrographs of blood, spleen and bone marrow.

## Signalment:

We received FNA of the spleen, bone marrow aspirate and a blood smear from a 4 year old intact male German Shepard dog on April 12. It had chronic weight loss, loose stools and a very good appetite in February. It then had mild anemia (hemoglobin 123 $\mathrm{g} / \mathrm{L}, \mathrm{RI} 150-190$ ) and moderate thrombocytopenia (PLT $91 \times 10^{9} / \mathrm{L}, \mathrm{RI} 150-500$ ) and a very large spleen. SNAP test was positive for Borrelia and Anaplasma in March. It was treated with Ronaxan (doxycycline) for 14 days. It still had thrombocytopenia but not anemia and had no diarrhea then. In April it had splenomegaly, thromobocytopenia and prominent poikilocytosis. Fine needle aspirates of spleen and bone marrow and a blood smear were submitted for diagnosis.

Table 1 Sysmex XT 2000 I V automated results April 12

| Analysis | Patient | Reference values |
| :--- | :--- | :--- |
| RBC | $7.4 \times 10^{12} / \mathrm{L}$ | $5.1-7.6$ |
| Hgb | $153 \mathrm{~g} / \mathrm{L}$ | $124-192$ |
| Hct | $0.46 \mathrm{~L} / \mathrm{L}$ | $0.35-0.52$ |
| MCV | 59 fl | $60-71$ |
| MCHC | $352 \mathrm{~g} / \mathrm{L}$ | $344-381$ |
| Reticulocytes | $0.9 \%$ | $0.3-2.4$ |
| Reticulocytes | $68 \times 10^{9} / \mathrm{L}$ | $19-150$ |
| PLT | $68 \times 10^{9} / \mathrm{L}$ | $108-562$ |
| WBC | $8.8 \times 10^{9} / \mathrm{L}$ | $5.6-20.4$ |
| Neutrophils | $7.5 \times 10^{9} / \mathrm{L}$ | $2.9-13.6$ |
| Lymphocytes | $3.3 \times 10^{9} / \mathrm{L}$ | $1.1-5.3$ |
| Eosinophils | $1.2 \times 10^{9} \mathrm{~L}$ | $0.1-1.2$ |
| Monocytes | $0.8 \times 10^{9} / \mathrm{L}$ | $0.2-1.1$ |
| MPV | Not reported | $9.1-12.7$ |

Figure 1 Blood smear appearance.

Questions

1. What cytological findings can explain a thrombocytopenia?
2. What can be concluded about the erythroid cells?
3. What type etiology may be suggested?

Figure 2 FNA spleen

Figure 3 FNA spleen

Figure 4 FNA spleen

Figure 5 FNA bone marrow aspirate
Bone marrow particles had normal to increased cellularity. M:E ratio was about 1.0. There was $16 \%$ lymphocytes and plasma cells.
